this book provides a detailed treatment of the various facets of modern sturm liouville theory including such topics as weyl titchmarsh theory classical renormalized and perturbative oscillation theory boundary data maps traces and determinants for sturm liouville operators strongly singular sturm liouville differential operators generalized boundary values and sturm liouville operators with distributional coefficients to illustrate the theory the book develops an array of examples from floquet theory to short range scattering theory higher order kdv trace relations elliptic and algebro geometric finite gap potentials reflectionless potentials and the sodin yuditskii class as well as a detailed collection of singular examples such as the bessel generalized bessel and jacobi operators a set of appendices contains background on the basics of linear operators and spectral theory in hilbert spaces schatten von neumann classes of compact operators self adjoint extensions of symmetric operators including the friedrichs and krein von neumann extensions boundary triplets for odes krein type resolvent formulas sesquilinear forms nevanlinna herglotz functions and bessel functions

the study of composition operators forges links between fundamental properties of linear operators and beautiful results from the classical theory of analytic functions this book provides a self contained introduction to both the subject and its function theoretic underpinnings the development is geometrically motivated and accessible to anyone who has studied basic graduate level real and complex analysis the work explores how operator theoretic issues such as boundedness compactness and cyclicity evolve in the setting of composition operators on the hilbert space  $h^2$  into questions about subordination value distribution angular derivatives iteration and functional equations each of these classical topics is developed fully and particular attention is paid to their common geometric heritage as descendants of the schwarz lemma

in this fully illustrated textbook the author examines the spectral theory of self adjoint elliptic operators chapters focus on the problems of convergence and summability of spectral decompositions about the fundamental functions of elliptic operators of the second order the author's work offers a novel method for estimation of the remainder term of a spectral function and its riesz means without recourse to the traditional carleman technique and tauberian theorem apparatus

tsince this work first came out in germany in 1924 this work has remained a standard in the field this translation restores the historically deep connections between physical intuition and mathematical development providing the reader with a unified approach to mathematical physics
