configuration management held in connection with the 1994 and 1995 IEEE International Conference on Software Engineering (ICSE). The 22 papers included give a unique overview on and introduction to current software configuration management issues. SCM is the discipline of managing software evolution; it is concerned with controlling evolving software products and supporting teams and activities involved in the development of complex software systems. SCM attracts the attention of SE design and development professionals, researchers, and software managers.

For more than 20 years, Network World has been the premier provider of information, intelligence, and insight for network and IT executives responsible for the digital nervous systems of large organizations. Readers are responsible for designing, implementing, and managing the voice, data, and video systems their companies use to support everything from business-critical applications to employee collaboration and electronic commerce.

This book constitutes thoroughly refereed post-conference proceedings of the workshops of the 16th International Conference on Parallel Computing (Euro-Par 2010) held in Ischia, Italy, in August-September 2010. The papers of these 9 workshops (HeteroPar, HPCC, HiBB, CoreGrid, UHPC, HPCF, Proper, CCPI, and VHPC) focus on promotion and advancement of all aspects of parallel and distributed computing.

A system can be viewed from different perspectives, each focusing on a specific aspect such as availability, performance, security. Configurations reflect the manageable resources of the system, their attributes, and organization, which are necessary for the management of the system. For each aspect, thus, for management purposes, a system is generally described through various partial configurations, also known as configuration fragments, to form a consistent system configuration. These independently developed configuration fragments need to be integrated together. The integration of configuration fragments is a challenging task. This is mainly due to overlapping entities, different logical representations of the same system resource in the configuration fragments, and/or complex relationships among the entities of the different configuration fragments. At runtime, the system may be reconfigured to meet certain new requirements or in response to performance degradations. These changes may lead to inconsistency as some changes may violate the constraints between entities. Maintaining the consistency and adjusting

the system configuration at runtime is another challenging task in our research we propose to handle these two important issues in an integrated manner we define a model based framework for configuration management we use the unified modeling language uml and its profiling mechanism for representing the configuration fragments using model weaving and model transformation techniques we propose a solution for the integration of configuration fragments targeting specific system properties to handle runtime changes we propose a configuration validation and adjustment solution to check and preserve the consistency of the system configuration we introduce a partial validation technique in which the runtime reconfigurations are checked against a reduced set of consistency rules instead of the complete set of rules and the reconfigurations are applied only if they are safe i.e. they preserve the configuration consistency for handling the changes that violate the consistency rules we propose an adjustment technique to automatically resolve if possible the inconsistencies this is achieved by propagating the changes in the configuration according to the system constraints following the possible impacts of the configuration entities on each other some heuristics are used to reduce the complementary changes and to limit the propagation we evaluate the complexity of our adjustment technique and conduct experiments to evaluate its efficiency the service availability forum middleware is used as an application domain in the examples throughout this thesis however the proposed solutions are applicable in more general settings we present proofs of concepts using different technologies we use the eclipse modeling framework emf and papyrus for implementing the uml profiles the atlas model weaver amw and atlas transformation language atl are used to integrate the configuration fragments and we also use the apis of the object constraint language ocl in the eclipse environment and the microsoft z3 constraint solver to develop a prototype tool of our partial validation and adjustment agents
